
goodpc, AMD Ryzen 5 5600X, 6 cores / 12 threads, 31.89 GB. No separate VM.

YARN is the earlier size-sweep run: 8 vcores, 2 reducers, no map-slot limit. It is not 1 core.

16 and 32 cores were requested. Both are this 12-vcore YARN run, shown once.

Wall clock starts after the matrix is loaded. HDFS put is excluded. Python is 1 worker. Same initial centres.

Map-slot limit is 4, 8, or 12. The ApplicationMaster uses one vcore, so the 12-vcore node runs at most 11 maps at once.
